

Assignment#4a (group, individual)

- Due Tuesday by 23:59
- Points 20
- Available after 13 May at 0:00

Please read the description for Assignments#4a and 4b together to get a complete picture of expectations for final stage of your project!

In this assignment, your group will demonstrate the prototype of your proposed solution and explain how the system would function in realistic scenarios. The purpose of this assignment is to show that your proposed solution is not only theoretically sound but also practically usable by stakeholders in the specific context of the Global South. Your demonstration should illustrate how users interact with the system, how information flows through the system and how the system supports decision-making for the community. Rather than simply showing the interface or mock-up, you should walk your TA through realistic usage scenarios that illustrate the value of your system.

To achieve this, your group must demonstrate the prototype through **at least three realistic usage scenarios in the particular context of your solution**. For example, a farmer receives real-time price data collected from regional markets, the parent of an autism affected child records their daily behavioral activities using a mobile application and shares with the the therapist, or using the disaster reporting application, a resident post location and photo of rising water level in nearby river during heavy rainfall. Each usage scenario should clearly demonstrate the i) user role (who is the user interacting with the system and what is their role in the community?), ii) user's goal (what problem is the user trying to solve?), iii) the steps taken within the system (also inputs required for these steps), iv) the information generated by the system (what output does the system generate and how is information presented to users?) and finally v) how does the system help the user make a decision or solve the problem?

In addition to good-weather scenarios stated above, briefly discuss **two potential edge case or limitations** of your system. For instance how the system will respond to incomplete or incorrect data submitted by users or conflicting reports from different users. What if there is low participation from community members, will the system still be successful. Are there chances of misuse of the system?

Although this is a group project, each member must demonstrate their **individual contribution** to the project. During the demonstration, each group member should briefly explain the part of the system they were responsible for, their role in the design, development, or analysis of the solution, key challenges they encountered and how they addressed them. Individual contributions will be graded separately. Each student should speak maximum for **1–1.5 minutes** about their contribution.

A suggested structure for the demo (~20 minutes) :

1. Brief introduction to the system (2 minutes)
2. Scenario 1 walkthrough (2 minutes)

3. Scenario 2 walkthrough (2 minutes)
4. Scenario 2 walkthrough (2 minutes)
5. Demo of random requirements from the ones stated by your group in previous assignments (2 minutes)
6. Discussion of edge cases and system limitations (3 minutes)
7. Individual contributions from group members (5 minutes)
8. Discussion (2 minutes)

The demos will be conducted in-person on 19th May in the class.
